

EVALUATION OF INSOMNIA

TYPE	CHARACTERISTIC
Sleep-onset insomnia	Difficulty falling asleep
Sleep maintenance insomnia	Frequent or sustained awakenings
Sleep offset insomnia	Early morning awakenings
Nonrestorative sleep duration	Persistent sleepiness despite sleep of adequate duration
INSOMNIA DURATION	CHARACTERISTIC
Transient	Insomnia complaint lasting one to several nights within a single episode (eg, acute illness, jet lag, shift changes)
Short-term	Insomnia lasting from a few days to 3 weeks (eg, associated with a longer duration of stress such as grief, stress, short-term illness)
Long-term or chronic	Insomnia lasting for months or years, often waxing and waning (eg, due to medical or psychiatric diseases, chronic stress, bereavement, primary sleep disorders)

MAJOR CATEGORIES OF SLEEP DISORDERS

Description	Type
PRIMARY SLEEP DISORDERS	
Sleep disorders thought to arise from endogenous abnormalities in sleep-wake generating or timing mechanisms, often complicated by conditioning factors.	Dyssomnias —characterized by abnormalities in the amount, quality, or timing of sleep.
	Parasomnias —characterized by abnormal behavior or physiologic events occurring in association with sleep.
MENTAL DISORDER-RELATED SLEEP DISORDER	
Presence of either insomnia or hypersomnia thought to be related to another mental disorder (eg, major depressive disorder, dysthymic disorder, mood disorder, generalized anxiety disorder, panic disorder, schizophrenia and other psychotic disorders, adjustment disorders, somatoform disorders, personality disorders).	Diagnosis of insomnia or hypersomnia due to another mental disorder should be made only when symptoms are severe and are an independent focus of clinical attention; the sleep disturbance may be one of the earliest symptoms in persons who subsequently develop an associated mental disorder.
GENERAL MEDICAL CONDITION RELATED SLEEP DISORDER	
Prominent disturbance in sleep due to a general medical condition and severe enough to warrant independent clinical attention.	History, physical exam, and lab findings suggest that the sleep disturbance is the direct physiologic consequence of a medical condition; the disturbance is not due to another medical disorder (eg, an adjustment disorder) and does not occur only during a delirium; breathing related sleep disorder or narcolepsy can be ruled out.
SUBSTANCE-INDUCED SLEEP DISORDER	
Prominent disturbance in sleep, thought to be due to direct physiologic effects of a substance (eg, drugs of abuse, medication, a toxin) or withdrawal from such a substance.	One of the 4 types of sleep disturbance seen: insomnia, hypersomnia, parasomnia, mixed-type insomnia.
